vivePDF web viewer

A sample document for trying the viewer

Pages drawn in your browser

Every page you see here was drawn by PDFium, compiled to WebAssembly and running in this browser tab.

Nothing was uploaded: the file came straight from the site, and only the parts on screen were downloaded.

Try the page thumbnails, the contents panel and search. Text can be selected and copied.

Settings on the tag

mode: sized, full, inline or lightbox

zoom: fit-width, fit-page or a percentage

theme: light, dark or auto

lang: tr or en

toolbar, search, print, download: false hides the control

accent: any CSS colour

Driving it from JavaScript

open() shows a file the visitor picked, a URL or bytes.

goTo(), setZoom() and search() move around the document.

vive-ready, vive-pagechange and vive-error report what happened.

Free under the MIT licence

The web viewer is a separate package, @vivepdf/viewer, and costs nothing to use on any site.
